1. The present application relates to a membrane pump comprising a working membrane which, when the pump is in motion, oscillates between a lower and an upper dead point.			
<p>The closest prior art is considered to be document WO-A-00 49293, cited in the search report and acknowledged on page 2 of the description. A membrane pump with a working membrane made of an elastic material is already known from said document, cracking being prevented therein by the provision of ribs on the upper side of the membrane. However, bulging of the membrane in its flexible annular region between the fixed edge and the central region cannot be prevented by means of circumferentially aligned ribs.</p> <p>The working membrane according to claim 1 differs from the aforementioned prior art by virtue of the provision of radially aligned and mutually spaced circumferential support ribs in the non-deformable region of the membrane, said support ribs being</p> <p style="text-align: right;">/...</p>

located on the lower side of the membrane. These features cannot be derived from any of the documents cited in the search report.

The subject matter of independent claim 1 therefore satisfies the requirements of PCT Article 33(1) and (2).

Dependent claims 2 to 7 relate to advantageous embodiments of the membrane pump according to claim 1. The subject matter of said claims is therefore novel and is not obvious from the prior art citations.
